Understanding Ray Tracing and Lenses

What is Ray Tracing?

Ray tracing is a technique used in physics and computer graphics to model the path of light as it interacts with various surfaces and media. In optics, ray tracing involves drawing the paths of light rays as they pass through lenses, mirrors, and other optical devices to understand how images are formed. This method helps visualize complex phenomena such as refraction, reflection, and image formation, making it an essential part of learning optics.

Types of Lenses

Lenses are transparent objects that bend light to form images. They are primarily classified into:

- **Convex lenses (converging lenses):** These lenses are thicker at the center and converge incoming light rays to a focal point, used in magnifying glasses, cameras, and corrective glasses.
- **Concave lenses (diverging lenses):** Thinner at the center and diverge light rays, used in devices like peepholes and some corrective glasses.
